

Common Borders. Common Solutions.

**A Scientific Network
for Earthquake, Landslide & Flood Hazard Prevention**

**Web-GIS Development
Deliverable No.: D.02.03**

GA 2. Geographic Information System Development

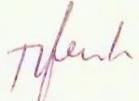

RESPONSIBLE: TEI OF KENTRIKI MAKEDONIA (ENPI Beneficiary)

INVOLVED PARTNERS: LP, P2 & P6

Project Details

Programme	Black Sea JOP
Priority and Measure	Priority 2 (Sharing resources and competencies for environmental protection and conservation), Measure 2.1. (Strengthening the joint knowledge and information base needed to address common challenges in the environmental protection of river and maritime systems)
Objective	Development of a Scientific Network
Project Title	A Scientific Network for Earthquake, Landslide and Flood Hazard Prevention
Project Acronym	SCInet NatHaz
Contract No	MIS-ETC 2614
Lead Partner	TEI OF KENTRIKI MAKEDONIA, GREECE
Total Budget	700.000,00 Euro (€)
Time Frame	
Start Date - End Date	01/05/2013 - 30/04/2015
Book Captain: Contributing Authors:	K. PAPATHEODOROU (TEI KENTRIKI MAKEDONIA) Konstantinos Evangelidis, Dimitrios Kotzinos, Alexandros konstantinidis, Anastasios Agrianidis

Document Release Sheet

Book captain:	K. PAPATHEODOROU (TEI CENTRAL MACEDONIA)		 K. Papatheodorou	29.11.2015
Approval	A.ANSAL (IPA - BU-KOERI)		 M. Atilla Ansal	29.11.2015

1 BACKGROUND OF THE DOCUMENT

1.1 SUMMARY

This document contains the major technical issues concerning the development of the SciNetNatHaz project's Web GIS application. The Web GIS application was designed and initially developed during the Group of Activities 2 (Geographic Information System Development) Activity 2.4 (Development of the Web GIS). The Web GIS application was optimized and enhanced during the project's life in order to satisfy the project's requirements and to comprise all the necessary geospatial data which were produced within the related project's activities (Activities 2.3.& 2.5) and the Group of activities (GA3).

1.2 SCOPE AND OBJECTIVES

The scope was the development of a Web GIS application in order to disseminate the geospatial data regarding flood, landslide and seismic hazard assessment in order to be freely available and be exploited by the decision makers and the public authorities as well. For this reason the application were designed and implemented taking into consideration the following:

- The ease of use: To be as simple as possible in order to be used also by non – experts in the domain of geoinformatics.
- More informative as possible: To presents all the descriptive information about the data and the methodologies that were used in order to produced.
- Freely accessed: Accessed with the use of a web browser application and no need for other specific software installation.

1.3 RELATED DOCUMENTS

1.3.1 Input

List of former deliverables acting as inputs to this document

Document ID	Descriptor
D.2.02	Geodatabase development
D.3.01- Vol. 1-3	Results from seismic, landslide and flood hazard assessment coming from regional & local implementation of adopted methodologies

1.3.2 Output

List of other deliverables for which this document is an input.

Document ID	Descriptor

2 INTRODUCTION

The WebGIS development is exclusively based on open source software components, not only as regards the final end-user web interface but also as regards the initial data preparation as well as the creation of the appropriate geospatial web services.

The spatial data published through the WebGIS platform are directly retrieved from the geodatabase implemented (D2.02). As additional data were collected during activity 2.5, mainly concerning floods hazard assessment, the geodatabase was enhanced and completed to meet project requirements.

Figure 1 displays the development process workflow, its discrete stages and the technical details during the transition between them. The following stages are identified:

- (1) Data Preparation
- (2) Desktop GIS - Spatial Data Presentation
- (3) Map Server - Web Map Services creation
- (4) WebGIS - End user interface development

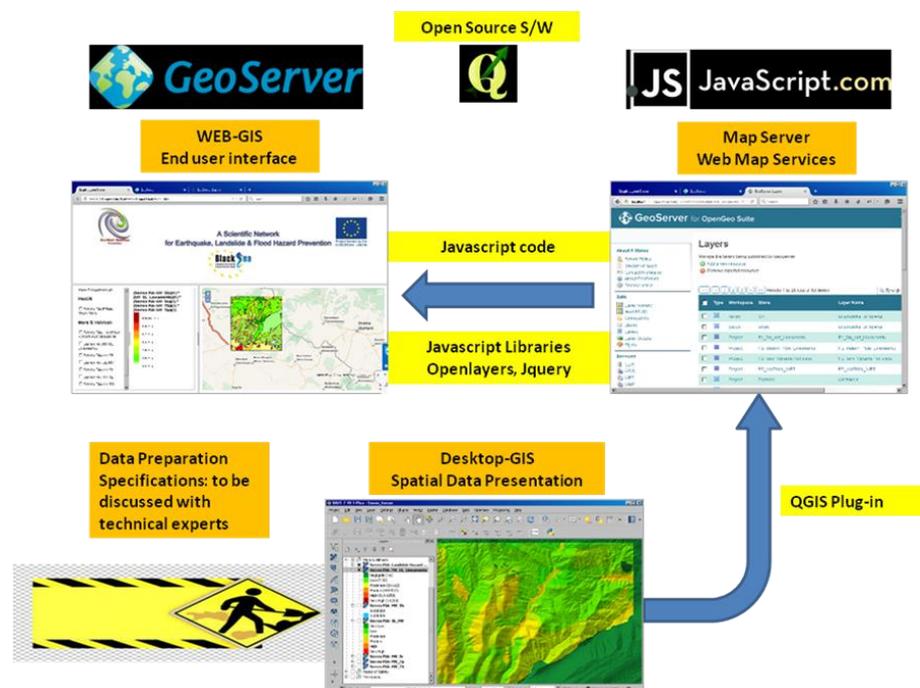

Figure 1: WebGIS development Workflow

The following paragraphs describe in detail each stage and the intermediate processes.

3 GEODATABASE

The geodatabase developed under GA2 (D2.02), was based on InGEOcloudS (Inspired GEOdata CLOUD Services) EC project, as regards, Earthquakes and Landslides hazard assessment related data. To also include Floods hazard, the proposed by InGEOcloudS data models were completed with additional ones. Therefore the Scinetnathaz geodatabase was updated with new data and in-situ measurements to cover Floods (Figure 2)

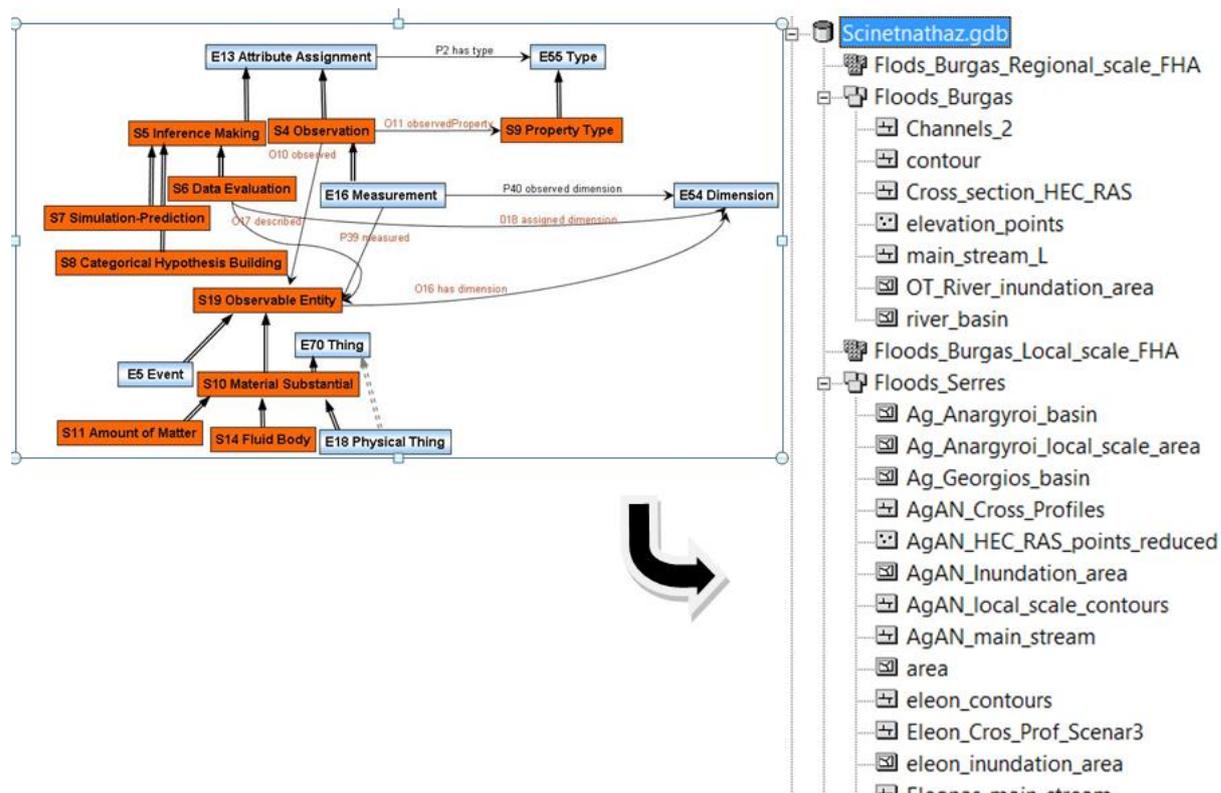

Figure 2: Geodatabase update/completion

4 DATA PREPARATION

Data preparation refers to the following data categories:

- General data (morphometric, geological, engineering etc.)
- Results after the application of selected methodologies

Depending on the hazard (flood, landslide or earthquake), the study area and the above mentioned categories, the following tree structure was adopted:

- Hierarchy Level 1: Hazard (Floods or Landslides or Earthquakes)
- Hierarchy Level 2: Pilot Implementation Area (e.g. Serres, Nymfaia etc.)
- Hierarchy Level 3: Data category (General Data or Results)

5 DESKTOP GIS - SPATIAL DATA PRESENTATION

At this stage data prepared on stage 1 are imported in the selected desktop GIS environment. For every pilot implementation area a QGIS (<http://www.qgis.org/en/site/>) project is deployed containing the appropriate groups of data, spatial reference, symbology, description and metadata information.

Below, the steps of the QGIS project deployment are briefly described.

5.1 STEP 1: ORGANIZING DATA IN THE SPECIFIED TREE STRUCTURE

In order to organize data the appropriate groups of data belonging to the same category have to be created. Grouping data is an area and hazard specific procedure. For example the groups created for presenting a hazard assessment contain morfometric and engineering geology data in the general data category, as shown in figure 3. In the same figure, the methodologies adopted are represented by different groups such as "Mora Vahrson" and "Hazus".

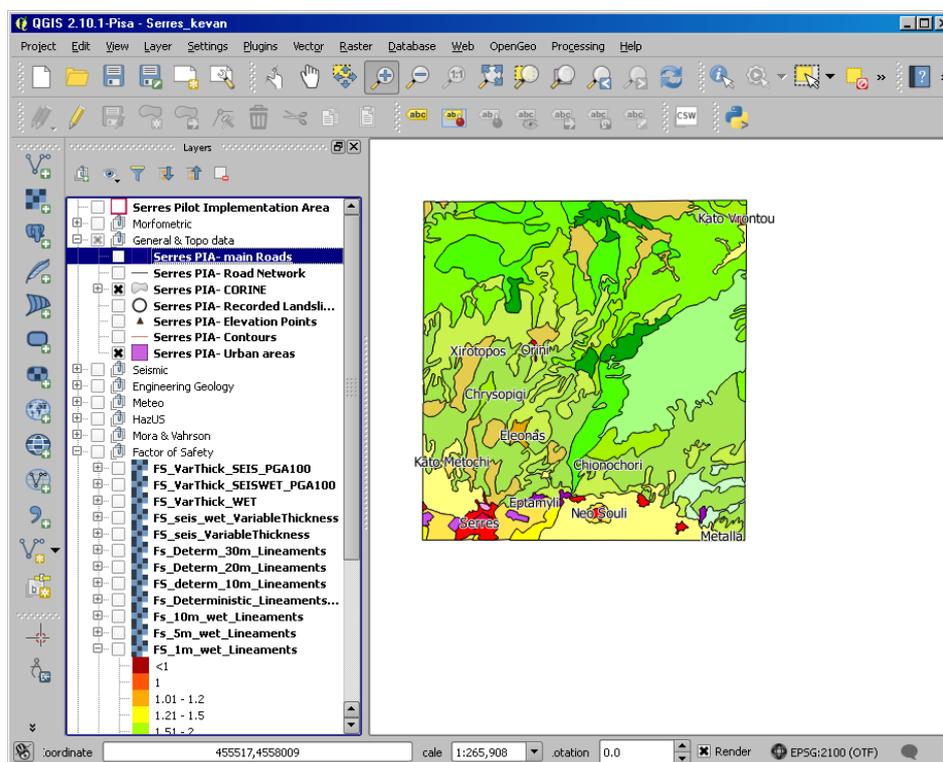

Figure 3: Organizing data for presenting a Hazard assessment

5.2 STEP 2: SYMBOLIZING DATA

Data symbology is crucial for interpreting the results of an assessment. By specifying the range of values that correspond to a color, a legend is created for every layer and this symbology (Figure 4) will be transferred also at the WebGIS interface.

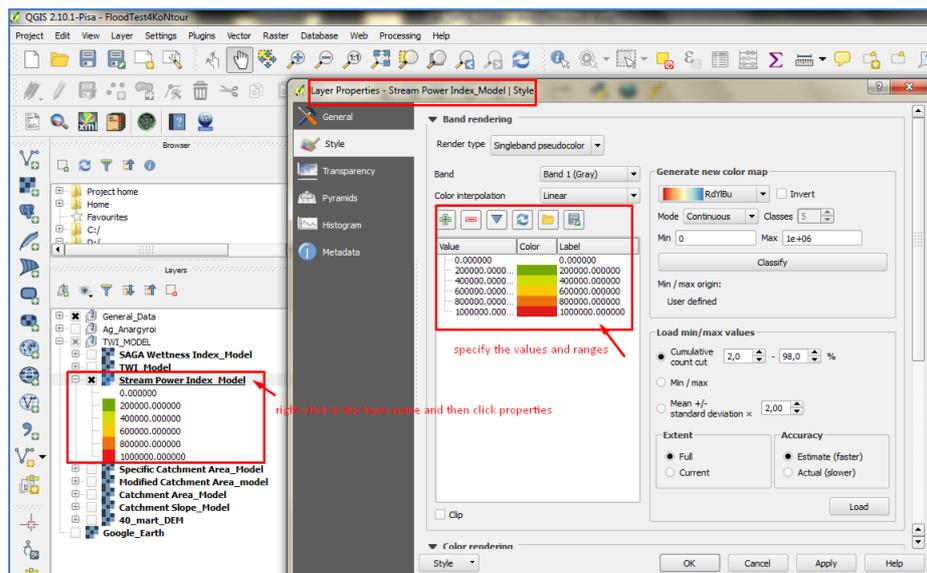

Figure 4: Data Symbology

5.3 STEP 3: DEFINING SPATIAL REFERENCE

All data should belong to the same spatial reference system, which is WGS84 (EPSG: 4326).

5.4 STEP 4: DESCRIBING DATA

A title and a brief description has to be provided in the 'Metadata' screen of every thematic layer properties interface as shown in figure 5

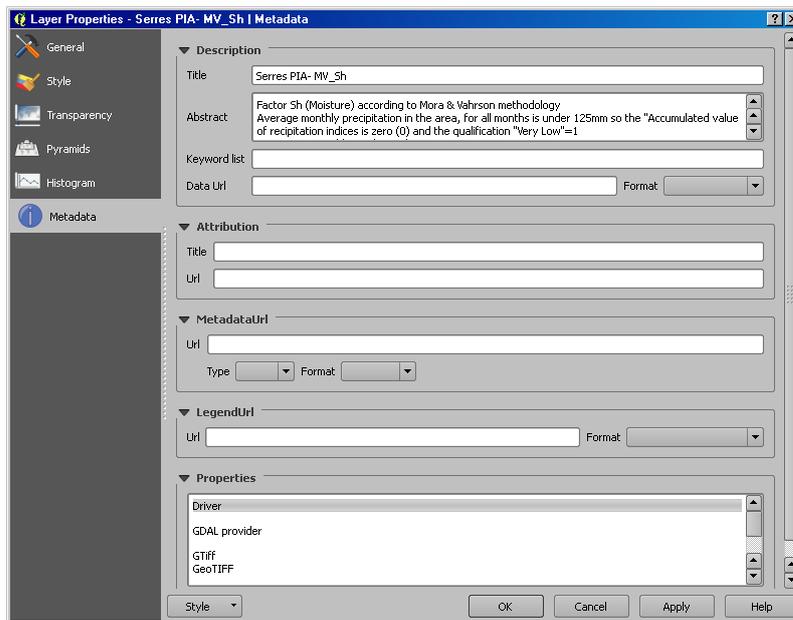

Figure 5: Providing Metadata

6 MAP SERVER - WEB MAP SERVICES CREATION

Desktop GIS data have to be transformed in a way that will allow its web publishing. An open source map server is employed for this purpose, which belongs to the same foundation as the desktop GIS software selected. Geoserver (<http://geoserver.org/>) is a web mapping project of the OSGeo (<http://www.osgeo.org/>) foundation, providing high level capabilities for sharing geospatial data. GeoServer supports OGC (<http://www.opengeospatial.org/ogc>) compliant standards such as Web Feature Service (WFS), Web Map Service (WMS), and Web Coverage Service (WCS).

For every group layer a related workspace was created in order to store its layers. Every layer of the QGIS project was imported via a the appropriate plug-in in the map server and a related Web Map Service was developed and parameterized as shown in Figure 6.

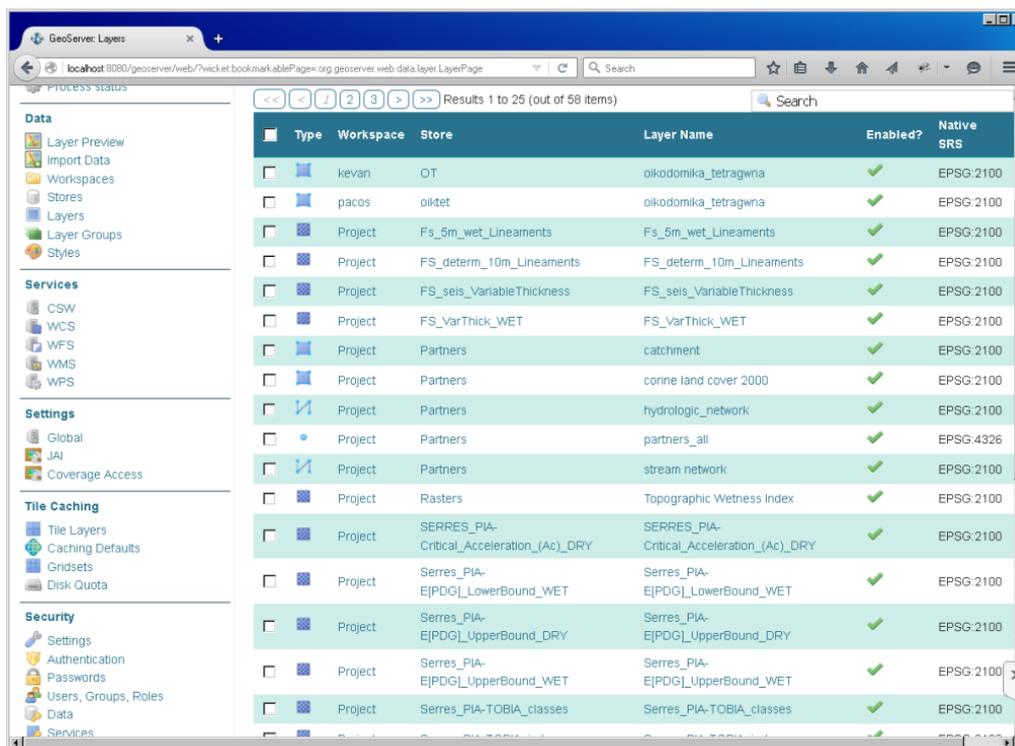

Figure 6: Creating geospatial web services

7 WEBGIS - END USER INTERFACE DEVELOPMENT

The WebGIS end user interface provides high quality navigation experience by providing project thematic layers spatial representations and on the same time metadata and related methodologies and technical specification information.

All of the WebGIS Interface functionality was developed with Javascript (<https://www.javascript.com/>) and HTML. The functional requirements as regards spatial data performance have been satisfied by employing OpenLayers (<http://openlayers.org/>) JavaScript libraries. For the purposes of dividing the interface area in functional subareas, JQuery (<https://jquery.com/>) JavaScript libraries were employed.

The WebGIS Interface was designed according to proven WebGIS projects such as "Eyes on the forest" (<http://maps.eyesontheforest.or.id/>) and contains three functional areas as follows:

- The left area (pane) containing the table of contents of the WebGIS environment: the "About" section area, the base layers section area and a section area for every major category (Floods, Earthquakes and Landslides). Any of the above areas unwraps further content subareas when selected, which in most cases are representing thematic areas with spatial vector and raster datasets. The structure of the various levels of layers follows the one adopted in stage 2 "Desktop GIS - Spatial Data Presentation".
- The middle area which reveals metadata information along with technical details for the selected topic of the left area, as defined in Step 4 "Describing data" of stage 2 "Desktop GIS - Spatial Data Presentation". It is worth mentioning that the middle area provides the corresponding to the left pane content information even on mouse over the desired layer.
- The right pane which contains the map of the selected pilot implementation area and the selected in the left pane spatial data layers.

The end user is allowed to customize the above areas with the desired width or to hide left and/or middle pane. The access to the WebGIS application is performed through the following URL (<http://webgis.scinetnathaz.net:8080/Scinetnathaz/>) or through the "Home" page of the project's website where there is a specific link to WebGIS.

}

function myFTWI ()

{

document.getElementById ("myDIV").innerHTML="TWI: The Topographic Wetness Index was

proposed to predict quick response flow by using morphometric parameters but has been used

since then to delineate flood prone areas.
Townsend et al. (1998) were used the

Topographic Wetness Index (TWI) that introduced by Beven and Kirkby (1979) in order to

measure the depth of inundation.
 $TWI = \ln(A_s/b)$, where A_s : upslope area and b :

slope
According to that, the water accumulation to a specific point (cell) of the

catchment's area is depends on the upslope area and the ground slope of this point (cell).

The use of TWI is not applicable to areas where the ground slope is very low (tends to

flat).
TWI can be computed through GIS software (QGIS, SAGA, ArcGIS) using as input data

a Digital Elevation Data (DEM). Thus the quality of the output is depending on DEM's

precision. The higher values of TWI, the greater the potential for those areas to be

saturated with water. Therefore, areas with high TWI values are more susceptible to flash

flooding as compared to those with low values.";

 Overall objective

The global objective is to achieve a strong regional partnership and cooperation by the

Development of a Scientific Network for the establishment a scientific consensus, in order

to setup common strategies and natural hazard prevention methods.

The Scientific Network members will work together sharing competencies and resources to

address earthquake, landslide and flood hazards which does have Trans - boundary

consequences both on the economy and on the environment.

Specific objectives

Setup common terminology, methodologies and strategies for Earthquake, Landslide and

Flood Hazards ELFH prevention.

Development of a Web Gis Platform that will support decision making and will also

provide data and information to the scientific community interested in Earthquake, Landslide

and Flood Hazards (ELFH), that promoting research and innovation regarding natural hazard's

prevention and preparedness in the Black Sea area.

Implement finally selected(developed or adapted) methodologies to access hazards on a

regional scale and on local scale in selected locations.

Provide training with open seminars and workshops.

Locations of the joint Action

Greece : Kentriki Makedonia-Serres , Anatoliki Makedonia Thraki-Komotini, Evros/Marica

river catchment within the eligible area, all towns

Bulgaria : Yogostochen, Evros/Marica river within the eligible area, all towns)

Turkey : Tekirdaq, Evros river catchment within the eligible area, all towns, Istanbul,

the wider area of Samsun.

Romania : NUTS II region of the South-East, Danube river delta wider area, all cities

Moldova : Moldova, Danube river delta wider area

Ukraine : Odessa, Danube river delta wider area, all cities
